                                                                                                                                                                                                                                  This sequence is a polypeptide from the immunoglobulin E receptor.

Sequences (AAY32794-Y32823) are examples of polypeptide sequences found

at or near the ubiquitin/proteosome complex binding site located on the

intracellular part of a cell surface receptor. These sequences are used

in a method for controlling the availability and signal transduction

capability of a cell surface receptor by administering an inhibitor that

capability of a cell surface receptor by administering an inhibitor that

capability of a cell surface receptor by administering an inhibition

confirmed to inhibiting proteclytic cleavage of the receptor. Inhibition

of this proteclytic cleavage results in the receptors being present on

the surface for longer and therefore signalling for longer to the

the surface for longer and therefore signalling for longer to the

confirmed to capability this increases the sensitivity of cells to any

competes with or binds to a polypeptide sequence of which sequences

AAY32794-Y32823 are examples. The inhibitor may be used to treat muscle

wasting, associated with disorders such as renal tubular defects,

curaemia, diabetes, Cushing's syndrome, cachexias, eating disorders, AIDS,

after stress and during neuromuscular disease

This sequence is derived from the growth hormone receptor polypeptide
AAY32792. This sequence and variants (AAY32794-Y32823) of it are examples
of polypeptide sequences found at or near the ubiquitinfyroteosome
controlled to the intracellular part of a cell surface
receptor. These sequences are used in a method for controlling the
availability and signal transduction capability of a cell surface
receptor by administering an inhibitor that is capable of inhibiting
proteclytic cleavage of the receptor. Inhibition of this proteclytic
cleavage results in the receptors being present on the surface for longer
and therefore signalling for longer to the interior of the cell. This
increases the sensitivity of cells to any hormones which might be
the inhibitor is either derived from, competes with or binds to
a polypeptide sequence of which sequences AAV3294-Y32823 are examples.
The inhibitor may be used to treat muscle wasting, associated with
disorders such as renal tubular defects, uraemia, diabetes, Cushing's
syndrome, cachexias, eating disorders, AIDS, after stress and during
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Growth hormone receptor; signal transduction; proteclytic cleavage; ubiquitin; protecsome binding site; muscle wasting; renal tubular defect; uraemia; diabetes; Cushing's disease; eating disorder; AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Controlling the availability and/or signal transduction capability of a cell surface receptor, useful for treating growth hormone deficiencies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Growth hormone receptor polypeptide for inhibition of receptor cleavage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence is from the intracellular domain of the growth hormone receptor. This sequence is an example of a binding site motif AAX32790. This motif is used in a method for controlling the availability and
Controlling the availability and/or signal transduction capability of a cell surface receptor, useful for treating growth hormone deficiencies.

; signal transduction capability of a cell surface receptor by administering an inhibitor that is capable of inhibiting proteolytic cleavage of the receptor. Inhibition of this proteolytic cleavage results in the receptors being present on the surface for longer and therefore signalling for longer to the interior of the cell. This increases the sensitivity of cells to any hormones which might be present. The binding motif, of which this sequence is an example, is located at or around a ubiquitin and/or ubiquitin/proteosome complex binding site. The inhibitor of the method is either derived from, competes with, or binds to this Signal transduction, proteclytic cleavage, growth hormone receptor; protecosome binding site, muscle wasting; renal tubular defect; uraemia; diabetes; Cushing's disease; eating disorder; AIDS; ubiquitin; growth hormone deficiency; inhibitor. Controlling the availability and/or signal transduction capability of a cell surface receptor, useful for treating growth hormone deficiencies. of the method is either derived from, competes with, or binds to this binding motif. The inhibitor may be used to treat muscle wasting, associated with disorders such as renal tubular defects, uraemia, diabetes, Cushing's syndrome, cachexias, eating disorders, AIDS, after stress and during neuromuscular disease Gaps .; 0 Score 25, DB 2; Length 12; Pred. This sequence is a polypeptide from the chicken growth hormone receptor.
Sequences (AAY32794-Y32823) are examples of polypeptide sequences found
at or near the ubiquitan/proteosome complex binding site located on the
intracellular part of a cell surface receptor. These sequences are used
in a method for controlling the availability and signal transduction
capability of a cell surface receptor by administering an inhibitor that
is capable of inhibiting proteclytic cleavage of the receptor. Inhibition
of this proteclytic cleavage results in the receptors being present on
the surface for longer and therefore signalling for longer to the
the surface for longer and therefore signalling for longer to the
the surface for longer and therefore signalling for longer to the
control might be present. The inhibitor is either derived from,
competes which might be present. The inhibitor may be used to treat muscle
AAY32794-Y32823 are examples. The inhibitor may be used to treat muscle
wasting, associated with disorders such as renal tubular defects,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, rarasporter, cycoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polymucleotides are particularly useful for treating or preventing
uraemia, diabetes, Cushing's syndrome, cachexias, eating disorders, AIDS, after stress and during neuromuscular disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptides (e.g. kinases, phosphatases, proteases, transporters, cytoskeletal proteins, receptors or transcription factors), useful for treating cancer, e.g. colon cancer, gastric cancer, sarcoma, lymphoma or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            myeloma, colon cancer, gastric cancer, adenocarcinomy, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence was used in the development of a novel assay for a putative regulator of cell cycle progression. The assay comprises expressing in a cell a protein comprising the E region and sufficient C-terminal residues of a DP-3 protein to provide a functional nuclear localisation signal (NLS), or the NLS of B2F-1, and a marker for nuclear localisation in the presence and absence of the putative regulator is determined. Regulators identified using the assay can be used as potential regulators of cell projification, or as models for rational drug design. Regulation of the NLS may lead to effects such as enhanced cell division, blocking of cell cycle progression or apoptosis. The regulators may also be used to design
specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Assays for identifying regulators of cell cycle progression - comprise expressing a protein having a transcription factor nuclear localisation signal and determining the degree of nuclear localisation.

The invention relates to 2175 novel human ovarian antigens (ABB41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polynoclocides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynocleotides against human ovarian antigens and the use of ovarian antigen polynocleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system clisorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders infertions (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and vaginitis), immune disorders (e.g., congenital and acquired framenosus), blood-related disorders (e.g., anaemia), cardiovascular disorders of and urinary system disorders. Ovarian antigen polypeptides and disorders ovarianty systemic lumined which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polynuclectides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynuclectides may further be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the polypoptides may be used as food additives or to prepare antibodies useful in disease diagnosis, druq targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AXX30724 to AXX30946 represent genomic DNA sequences isolated from Streptococcus pneumoniae strain 0100993. These genomic DNA sequences encode the novel proteins given in AXY1114 to AAX11367. The proteins, isolated from Streptococcus pneumoniae, can be used in vaccines against streptococcal infections and in assays for identifying compounds that inhibit or activate the activity of the proteins. The antagonists can be used to treat an individual having need to inhibit a bacterial protein. Vectors expressing the proteins can be used to induce a protective immune response in mammals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids encoding pneumococcal polypeptide(s) - useful in vaccines,

AXY97916 to AAX98029 represent 110 isolated human secreted protein genes.
AXY36224 to AAX16727 represent the secreted proteins encoded by the 110 human genes. The genes and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating secreted polypeptides are useful for preventing the amount of the new polypeptides in a sample or by protein or gene therapy. Also pathological conditions can be diagnosed by determining the presence of mutations in the new genes. Specific uses are described for each of the 110 genes, based on which tissues they are most nightly expressed in, and include developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, autoimmune discases, inflammation, allergies, Altheimer's and cognitive disorders, atherosclerosis, diabetes, cardiovacular disorders, kidney disorders, atherosclerosis, diabetes, cardiovacular disorders, kidney disorders, disouse also useful for identifying their binding partners. The polypeptides are also useful for identifying their binding partners. The sequences given in AAX97907 to AAX97915 and AAX16223 are used in the exemplification of

The present sequence is that of amino acids 7-54 of a phospholipid transporter consensus sequence, denoted ATPase hydrolase phosphorylation transporter consensus sequence, denoted ATPase hydrolase phosphorylation. This sequence shows 56% identity with a phospholipid-transporting multigene. This sequence shows 56% identity with a phospholipid-transporter of the invention, designated 6710% (see ABP72495). The invention provides 6710% nucleic acids and polypeptides, vectors, host cells, antibodies and transgenic animals. The 6170% nucleic acids and polypeptides are useful for diagnosing, preventing or treating conditions related to aberrant activity or deficient phospholipid transporter function or expression, such as neurological disorders, callular proliferative and/or differentiative disorders, immume disorders, inflammatory disorders, viral diseases, cardiovascular disorders, blood coagulation disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New 61708 nucleic acid molecules and polypeptides, useful for diagnosing or treating conditions related to aberrant activity or deficient phospholipid transporter function or expression, e.g. autoimmune disease,
    increase or decrease storage capabilities, fat content or other untritional components. The present sequence represents the amino acid sequence of a novel human secreted protein. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at seqdata.uspto.gov.uk/sequence.html?DocID=20030055236.
                                                                                                                                                                                                             Score 25; DB 6; Length 45;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Phospholipid transporter; ATPase; enzyme; 67108.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated HXABT24 nucleic acid molecule. The polypeptides, mucleic acids and antibodies are useful for diagnosing a pathological condition or a susceptibility to a pathological condition, for preventing, treating, or ameliorating a medical condition, such as cancer, inflammation and other immune disorders, neurological and blood clotting disorders. The nucleic acids are also useful for thromosome identification, radiation hybrid mapping or long-range restriction mapping. The polypeptides and antibodies are useful for providing immunological probes for differential identification of the tissues immunological probes for differential identification of the tissues immunological probes for differential identification decreases and antiagonist may also be used as a food additive or preservative to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New secreted HKABT24 nucleic acid molecules and polypeptides, useful for preventing, treating, or ameliorating a medical condition, such as cancer, inflammation, immune disorders, neurological and blood clotting

g

```
Protein comprising a variant of model C-type lectin-like domains (CTLD), in which alpha helices, beta-strands, connecting segments are conserved to maintain CTLD scaffold structure, while the loop region is altered.
                                                                                                                                        Scaffold protein; C-type lectin-like domain; CTLD; alpha-helix; beta-strand; connecting segment; 14loop region; tetranectin; ligand-binding specificity; human; mouse; rat; chicken; trout; cow.
                                                                                                                                                                                                                                                                                                         Thogersen HC;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
The present invention relates to a new protein with scaffold structure of c-type lectin-like domains (CTLD). The invention comprises a variant of a model CTLD where alpha-helices and beta-strands and connecting segments are conserved such that scaffold structure of C-type lectin-like domains are conserved such that scaffold structure of C-type lectin-like domains (CTLD) is substantially maintained, while the 14loop region is altered by amino acid substitution, deletion, insertion or their combination. The invention is useful for preparing a library of nucleotide sequences convention is useful for preparing a library of nucleotide sequences invention is proteins by randomising part or all of the nucleic acid proteins by randomising part or all of the nucleic acid proteins products are preferable to antibody derivatives as each binding components of compositions to be used for in vivo diagnostic or therapeutic purposes, arrificial CTLD protein products constructed on the basis of human CTLDs are virtually identical to the corresponding natural communogenic to the patient. They also have a smaller size, and thus immunogenic to the patient. They also have a smaller size, and thus crowing specificatly defining of polypeptide segments defining clayatives may be achieved. The present amino acid sequence represents a curring of privatives.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 25; DB 5; Length 54; 50.0%; Pred. The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SERPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

```
Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human placenta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New spatially-addressable set of single exon nucleic acid probes, useful
                                                                                                                                                                                                                                                                                                      The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; microarray; single exon probe; gene expression; breast; disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ó.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and sipplaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide economic but was obtained in electronic format directly from WIPO
for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes.
                                                                                SEQ ID NO 13482; 327pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 56 AA;

Single exon nucleic acid probes for analyzing gene expression in human hearts.

```
The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e-g. cardiovascular diseases of the hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                 Claim 15; SEQ ID NO 22876; 530pp; English.

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human bone marrow.

Example 4; SEQ ID NO 29176; 658pp + Sequence Listing; English.

probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention The present invention provides a number of single exon nucleic acid

The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (1) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG4734e-ABG59930 represent human liver single exon encoded peptides of the invention. Note The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at fig., wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide #3091 encoded by probe for measuring breast gene expression.
                                                                                                                                Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia,
hypercholesterolaemia, coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 25; DB 4; Len

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention

The present invention relates to novel single exon nucleic acid probes (see AA100010-AA110067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a predicting, diagnosing, grading, staging, monitoring and prognesing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include breast cancer, disorders of development inflammatory diseases include breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumours. Note: The sequence data for obtained in electronic form part of the printed specification, but was chemical in the contraction of the printed specification, but was
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel single exon nucleic acid probe used to measuring gene expression in
                                  inflammatory disease; proliferative breast disease; non-carcinoma tumour.

The invention features to a spatially-addressable set or single exon mucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes; the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung; comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung array; identifying exons in a eukaryotic genome, comprising (a) array; identifying exons in a eukaryotic phound to each probe of the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote; burg mentioned microarray; assigning exons to a single exon probe thaving a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types using hybridisation to a single comprising one collective microarrays mentioned in the specification, or encoded by the corpobes/open reading frames (ORP). The probes are used for identifying exons in a gene, particularly using human cancer, chronic obstructive pulmonary diseases (DOPD), interstrial lung dienses, duseases (ILD), familial idiopathic pulmonary fibrosis, encoreded by the rule rule mulmonary and encoded by the rule mulmonary and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present sequence is a peptide/protein encoded by a single exon probe of
the invention. Note: The sequence data for this patent did not form part
of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary histicocytosis, lymphangiolelomyomtosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  7-JUN-7
The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can threefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The present invention describes an Oropouche NP (nucleocapsid) protein. The Oropouche virus belongs to the genus Bunyavirus of family Bunyaviride. The Oropouche NP protein can be used to detect anti-NP antibodies, for diagnosis of Oropouche virus infection and for protein is used to design: (i) oligonucleotide primers for diagnostic reverse transcription polymerase chain reaction (RT PCR) of viral RNA infected cell cultures or serum samples; or (ii) probes for hybridisation reactions with viral RNA. Also, the nucleic acid sequence may be used in vaccines to protect against Oropouche virus infection. The present samples coppute virus infection. The present plasmid, which is used in an example from the present invention. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                               New DNA encoding the nucleocapsid protein of Oropouche virus - used for diagnosing Oropouche virus infection and in vaccines against this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; foetal liver; gene expression; single exon nucleic acid probe.

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, lenkaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human genome-derived single exon nucleic acid probes useful for analyzing
     predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                Human; bone marrow expressed exon; gene expression analysis; probe; microarray; cancer; leukaemia; lymphoma; myeloma.
                                                                                                                                                                                                                                                                                                                                     Human bone marrow expressed probe encoded protein SEQ ID NO: 37259.

                                                                                                                                                                                                                                                                                                                                   ;
                                                                                                                                      The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                    Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for

ó:
probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of
                                                                                                                                                                                                                                                                                                                                                             Gaps

Homo sapiens

The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements) fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from MIPO at Human genome-derived single exon nucleic acid probes useful for analyzing Claim 27; SEQ ID NO 37263; 658pp; English Chen W, Rank DR; gene expression in human adult liver.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        07-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     08-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       14-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       16-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       16-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         17-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       18-JUN-1999
   The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recarion (PGN) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and anno acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this electronic format diarectly from WIPO at the sequences of the invention. Once: The sequence data for this electronic format directly from WIPO at the will be added to the printed specification, but was obtained in electronic format diarectly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0

                                                                                                                                                                                                                                                                                               The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention
                                                                                                                                                                                           New protein from Neisseria gonorrheae, useful for the manufacture of medicament for treating or preventing N. gonorrheae infection.

SM Ruben (HUMA-) HUMAN GENOME SCI INC Rosen CA, Barash SC,

WPI; 2001-488783/53. N-PSDB; AAS26587.

New nucleic acid molecules encoding 461 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives.

Claim 11; SEQ ID NO 1553; 980pp; English.

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic

New polypeptide designated ORFX are present in human atherogenic cells and are useful to prevent and treat ORFX-associated disorders including cancer, allergy, wound healing or autoimmune, cardiovascular or inflammatory disease.

Claim 10; SEQ ID NO 1236; 78pp; English.

The present invention relates to novel human ORFX polypeptides and their coding sequences (ABP63631-ABP64681 and ABQ98194-ABQ99267). The sequences

                                                                                         blood
                                                                                                     data
were discovered in human atherogenic cells, in particular in platelets and human unbilical vein endothelial cells (HUVEC) and are expressed in many other tissues as well. Atherogenic cells are cells which have the potential to develop atherosclerotic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX-associated disorder, e.g. cancer, cardiovascular disease, allergy, autoimmune disease, wound healing, bloo coagulation disorders or inflammatory disorders. ```
The invention relates to human novel polypeptides and their associated therapy for treating, inhibiting or preventing neural disorders, immune system disorders (e.g. inhibiting or preventing neural disorders, inmune system disorders (e.g. system; lupus erythematosus, rheumatoid arthritis and multiple sclerosis), muscular disorders, respiratory diseases (e.g. campaultis, nasal polyps and sinualis), reproductive disorders, gastrointestinal disorders, pulmonary disorders, cardiovascular disorders, c.g. congenital heart defects, Ebstein's anomaly and hypoplastic left (e.g. congenital heart disorders (e.g. acute kidney failure and end stage creat disorders (e.g. spendicitis), inflammatory diseases (e.g. septic shock, bursitis and capendicitis), allergic reactions and conditions (e.g. asthma), blood crelated disorders (e.g. thrombosis, atherosclerosis and myocardial cifarction) and cancerous diseases. Sequences ABU55748 represent human novel polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polypeptides and nucleic acids, useful in gene therapy for treating, inhibiting or preventing e.g. neural, immune system, muscular, respiratory, reproductive, gastrointestinal, pulmonary, cardiovascular or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ; Score 25; DB 6; Length 68; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is a polypeptide encoded by one of a large number of 5. ESTB derived from mRNAs encoding secreted proteins. The 5. ESTB were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTB are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTB are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention
                                                                                                                                                                      New protein from Neisseria gonorrheae, useful for the manufacture of a medicament for treating or preventing N. gonorrheae infection.
                                                                                                                                                                                                                                  present invention relates to proteins from Neisseria gonorrhoeae.

                              The invention describes a complex of protein-protein interactions in Helicobacter pylori selected from 421 complexes given in the specification. The complex of protein-protein interactions are useful for screening for agents which modulate the interaction of proteins. Modulating compounds which binds to a targeted bacterial protein may be used for treating or preventing ulcers in a human or animal. This is the amino acid sequence of a selected interacting domain (SID), identified via protein-protein interactions. Note: Where the patent number printed at the top of the pages in the specification has obscured areas of protein sequence, the indexer has replaced the residue with an X to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (see Table 1

particularly of breast or prostate, or a genetic disease, in humans or

```
Screening for non-ocular disease - by analysing tears for marker proteins, particularly indicative of cancer and genetic disease, also new proteins and nucleic acid encoding them.
disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with OREX-associated disorder. OREX polynucleotide sequences can be used in gene therapy. OREX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, Reloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune disorders such as multiple sclerosis, rhemmatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The markers AAW61647-W61649 are used for screening for, or detecting, nor occular disease by analysing tears. Biochemicals, specifically proteins, are isolated from tears, particularly by chromatography or electrophoresis, especially two-dimensional polyacrylamide gel electrophoresis (2D-PAGE), then detected, e.g. with labelled specific reagents, in (radio)immunoassay. The method is used to detect cancer,
                                                                                                                                                                                                     arthritis, autoimmune thyroidists, myasthenia gravis, graft-versus-host disease and autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from systemic cytokine damage. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                                                                                                                 epidermidis; open reading frame; ORF; bacterial infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated nucleic acid encoding a Staphylococcus epidermis polypeptide, useful for diagnosing and treating bacterial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The sequence is that of a Streptococcal polypeptide. The polypeptide can potentially be used for the diagnosis and prevention of bacterial infections, especially SP infection. It may be used for the treatment of diseases such as otitis media, conjunctivitis, pneumonia, bacteremia, meningitis, sinusitis, pleural empyema, endocarditis or infection of the cerebrospinal fluid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypethyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune chyroiditis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New Acinetobacter baumanii proteins and nucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated Acinetobacter baumannii nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27252 encode the human ORFX proteins given in ABD0010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX associated disorder. ORFX polynucleotide squences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, disorders related to organ transplantation, cardiovascular diseases, disorders, infectious diseases, autoimmune disorders such as multiple sclerosis, rheumatoid arbitis, autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut transplants in the protection or regeneration and treatment of lung or liver form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            reperfusion injury in various tissues and conditions resulting from systemic cytokine damage. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp, wipo.int/pub/published_pct_sequences

This sequence is a plant aminoacyl-tRNA synthetase of the invention. The aminoacyl-tRNA synthetases are selected from isoleucyl-tRNA synthetase, it lysyl-tRNA synthetase, phenylalanyl-tRNA synthetase, and prolyl-tRNA synthetase, phenylalanyl-tRNA synthetase, and prolyl-tRNA synthetase. The nucleic acid fragments may be used to create transgenic plants in which the polypeptides are present at higher or lower levels than normally found. This would have the effect of altering the level of aminoacyl-tRNA synthetase activity and gene expression in those cells. The polypeptides can be used as a targets to facilitate design and/or identification of inhibitors of those enzymes that may be useful as herbicides. All or a substantial portion of the nucleic acid fragments may also be used as probes for genetically and physically mapping the genes. Such information may be useful in plant breeding in order to develop lines with desired phenotypes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                         Isolated polynuclectide encoding plant isolewcyl-LRNA synthase, useful for creating transgenic plants and as targets to facilitate design and/or identification of inhibitors that may be useful as herbicides.

                                                                                                                                                                                                                                                                     NDC-01
                                                                                                                                                           20-MAY
The invention describes an isolated nucleic acid fragment encoding an isoleucyl-tRNA synthetase, a lysyl-tRNA synthetase, a phenylalanyl-tRNA synthetase. The nucleic acid fragments encoding aminoacyl-tRNA synthetases are useful in developing new herbicides that target aminoacyl-tRNA synthetases and engineer aminoacyl-tRNA synthetases and engineer aminoacyl-tRNA synthetases that are resistant to the herbicides. The nucleic acid fragments are also useful in facilitating studies to better understand protein synthesis in plants, providing genetic tools for the manipulation of gene expression, or providing possible target for herbicides. The polypeptides are useful as targets to facilitate design and/or identification of inhibitors of the aminoacyl-tRNA synthetases that may be used as herbicides. This is the aminoacyl-tRNA synthetases that may trNA synthetase clone r1s2.pk0006.c10
                                                                  New nucleic acid fragments encoding aminoacyl-tRNA synthetases, useful in developing new herbicides that target aminoacyl-tRNA synthetases and engineer aminoacyl-tRNA synthetases that are resistant to the herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

```

```
The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an B-value greater by a factor of 3 than the B-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms.
                                                                                                                                                                                                                                                                                        Gaps

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27522 encode the human ORFX in the specification). ABN15762 to ABN27522 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a squances can be used in gene therapy. ORFX sequences can be used in the therapy. ORFX sequences can be used in the sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, comparise, bening tumnours, kebloid, degenerative disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic storage disease, various immune deficiencies and disorders, intertious diseases, autoimmune thyroiditis, myasthenia gravis, rheumatoid attention autoimmune inflammatory eye disease. ORFX proteins are also cuseful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut compared or systemic cytokine damage. N.B. The sequence data for this patent did not form after the printed specification, but was obtained in electronic formers of the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .;

This sequence comprises human endometrial specific steroid binding factor III (ESF III), a protein that inhibits phospholipase A2 activity, binds to polychlorinated biphenyl compounds, reduces foreign protein antigenicity, inhibits monocyte and neutrophil chemotaxis and phagocytosis, inhibits monocyte and neutrophil chemotaxis and controls the growth of endometrial cells. The amino acid sequence was deduced from a CDNA clone (see AAT94832) derived from a human endometrial tumour. ESF I (see AAW35802) and ESF II (see AAW35802) and ESF II (see CAAF98832) and ESF II II (see CAAF98832) and ESF II II or III (including expression of the ESF II II or III (including expression of the CAFF III or III (including expression of the ESF polypeptide. hESF II and III may be used the continual continual continual continual children in vivo) and (b) for identifying compounds which bind to and inhibit activation of the ESF polypeptide. hESF II II and III may be used to the ESF polypeptide. hESF II II and III may disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human endometrial specific steroid-binding factor I, II and III - used to treat inflammation, asthma, rhinitis, cystic fibrosis, airway disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Endometrial specific steroid-binding factor III; ESF III; human; Clara cell secretory protein; endometrium; phospholipase A2 inhibitor; polychlorinated biphenyl; antiaggregant; inflammation; asthma; rhinitis; cystic fibrosis; airway disease; neoplasia; atopy; therapy; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human endometrial specific steroid-binding factor III.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1. .21

```
The present sequence represents a human mammoglobin homologue (HWH).
Antagonists of the HMH polypeptide can be used to treat neoplastic
disorders including adenocarcinoma, leukemia, lymphona, melanoma,
myeloma, sarcoma and teratocarcinoma. A vector expressing the complement
of the polymucleotide encoding HMH may be administered to a subject to
treat or prevent neoplastic disorders or endometriosis. Antibodise which
bind HMH may also be used in the disorders of conditions or diseases
claracterized by expression of HMH, or in assays to monitor patients
being treated with HMH, agonists, antagonists or inhibitors.
Cobyructeotides encoding HMH may also be used diagnostically to detect
and quantitate gene expression in biopsied tissues. With respect to
cancer a relatively high amount of transcript may indicate a
predisposition for the development of disease. The nucleic acid sequences
which encode HMH may also be used to generate hybridization probes useful
for mapping the naturally occurring genomic sequence. HMH, and its
fragments/variants can be used for screening libraries of compounds in
drug screening techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human mammoglobin homolog (HMH), useful for diagnosing, treating or preventing disorders associated with expression of HMH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

sequences, corresponding to human secreted proteins. AAY4651 to AAY5438 sequences, corresponding to human secreted proteins. AAY4651 to AAY5438 represent the EST-related proteins corresponding to AAZ42265 to AAZ43052.

The 5. BSTs can be used for producing secreted human gene products. They can be used to identify and isolate 5' untranslated regions (UTRs) and upstream regulatory regions which control the location, development stage, rate, and quantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for chromssome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forensic procedures to identify individuals, or in diagnostic procedures to identify individuals, or in diagnostic procedures to identify individuals per consist of indiance acids encoding signal peptides can be used in gene therapy protocols. The cucleic acids encoding signal peptides can be used for directing extracellular secretion of a polypeptide or the insertion of a collypeptide into a membrane, or importing a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in treating a variety of human conditions. Secreted proteins la valueble. AAZ42249 to AAZ42264 and AAX64644 to AAX6650 represent sequences used in the exemplification

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to nucleic acid molecules encoding portions of the human endometrial specific steroid-binding factors I, II, and III. Also included in the invention are hESF I, II, and III polypeptide sequences. The included in the invention are hESF I, II, and III polypeptides sequences. The included in the invention are hESF I, III and III polypeptides are used in gene therapy to express hESF I, II and III polypeptides in vivo to treat and/or prevent inflammation, asthma, rhinitis, cystic fibrosis, air way disease, neoplasia and actory. The polymuclectides are also used to inhibit phospholipase A2 activity, bind polychorinate block to inhibit phospholipase A2 activity, bind polychorinate elosation of inhibit phospholipase A2 activity, inhibit monocyte and neutrophil chemotaxis and phagocytosis, inhibit platelet aggregation, regulate elosatoid cand phagocytosis, inhibit platelet aggregation, regulate elosatoid cand phagocytosis, inhibit platelet aggregation, regulate elosatoid con polymucleotides are also useful for detecting complementary colling phymoleotides are also useful for detecting complementary polymucleotides are used to detect complementary polymucleotides such as associated with a dysfunction will provide a diagnostic tool that can define diagnosis of a disease or susceptibility to a disease which can be the from under-expression, over-expression of a commetrial cancer. They are also useful for chromosome identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .;

                                                                                                                                                                                                                                                                                    The levels of human endometrial specific steroid binding factor (ESBPIII) can be measured and compared to control levels and used to diagnose the presence of a gynaecological (uterine, breast, endometrial, or ovarian) cancer in a patient. ESBPIII levels can also be used to diagnose metastasis, to stage or monitor gynaecological cancer. Antibodies specific for ESBPIII can be used to treat gynecological cancers
                                                                                                                                                                                                                                       staging and monitoring gynecological cancer comprising using level of ESBPIII in a patient as an indicator of cancer.

Clone Mamm-X encodes a polypeptide that is 100 pecent identical to human Mammaglobin B precursor, a potential marker of breast cancer nodal metastasis. The sequences are useful for treatment of diseases such as cancer, immune disorders, autoimmune disease, acquired immune deficiency syndrome (AIDS), transplant rejection, allergy, infection by a pathological agent or organism, inflammarory disorders, arthritis, a haematopoietic disorder, a skin disorder, alberosclerosis, restenosis, a neurological disease, Alzheimer's disease, trauma, spinal cord injury and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, endometrial specific steroid binding factor, hESF, hESF1; hESFII; hESFIII; inflammation; asthma; rhinitis, cystic fibrosis, airway disease, neoplasia, atopy; phospholipase A2; polychlorinated biphenyl; chemotaxis; phagocytosis; platelet aggregation; eicosanoid; endometrial cell.
acids encoding polypeptides with syncline-like, claudin-like or a-like activity, useful for treating diseases including cancer,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a peptide comprising the amino acid sequences of human lipophilin A, B, or C or its allelic variant or fragment comprising at least one immunogenic epitope, which is purified and isolated, and may have the N-terminal acylated and/or C-terminal amidated or be a fusion protein. Molecules of the invention are used in the diagnosis and prognosis of malignant tumours associated with hormonally regulated organs such as uterus, ovary, prostate, testis, breast, kidney and thymus. This sequence represents the human Lipophilin C protein of the
                                                        The present sequence represents a human endometrial specific steroid hinding factor (hESF). The specification describes hESFI, hESFII, and hESFIII. I and III polypeptides, and polymucleotides encoding them are useful for treating and preventing inflammation, asthma, rhinitis, cystic fibrosis, airway disease, neoplasia and atopy, inhibiting phospholipase A2 activity, binding polychlorinated biphenyls, reducing foreign protein antigentity, inhibiting monocyte and neutrophil chemotaxis and phagocytosis, inhibiting platelet aggregation, regulating encommental levels in the human uterus, and for controlling the growth of endometrial cells. hESF polypeptides and nucleotides are also useful for research, biological, clinical or therapeutic purposes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptides having the sequence of human lipophilin A, B and C are associated with carcinomas of hormonally regulated organs and are useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a new method for assessing whether a patient is afflicted with ovarian cancer. The method involves comparing the expression level of a marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where the marker is selected from 36 cancer markers described in the specification. The method of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as possible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing ovarian cancer (e.g. patients having a familial history of ovarian
                                                                                                                                                                                                                                                                                                                                  Human; ovarian cancer, marker, cancer, familial history, brain disorder, central nervous system disorder, bacterial meningitis; viral meningitis; Alzheimer's disease, Parkinson's disease, cerebral oedema, hydrocephalus; brain herniation; inflammation; encephalitis; testicular disorder; nontuberculous granulomatous orchitis; connective tissue disorder; heart disorder; ischaemic heart disease; atherosclerosis; neoplasm; histological type; carcinogenic; ovarian cancer marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Assessing whether a patient is afflicted with ovarian cancer, useful in assessing the stage or progression of the disease, comprises comparing the expression level of a cancer marker in a sample from a patient and

                                                                           testicular disorders (e.g. nontuberculous granulomatcus orchitis), connective tissue disorders, or heart disorders (e.g. ischaemic heart disease or atherosclerosis). The compositions and methods may also be used in assessing the histological type of neoplasm associated with ovarian cancer, monitoring the progression of ovarian cancer, determining whether ovarian cancer has metastasized or is likely to metastasize, selecting a composition for inhibiting ovarian cancer, assessing the ovarian carcinogenic potential of a compound, or inhibiting ovarian cancer or at risk of developing ovarian cancer. The present amino acid sequence represents one of the ovarian cancer markers described in the
             of e.g. brain and central nervous system disorders (e.g. bacterial and viral meningitis, Alzheimer's disease or Parkinson's disease), brain disorders (e.g. cerebral oedema, hydrocephalus or brain herniations), inflammations (e.g. bacterial or viral meningitis or encephalitis),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antibody specific for human endometrial specific steroid-binding factor (hESF) III, useful for detecting hESF III protein in biological sample and to isolate or identify clones expressing the protein.

                                                                                                                                                                                                                                                                                                                                                                δ
```

The present sequence represents a endometrial specific steroid-binding

```
;
factor (hESF) III. The full length protein has a molecular weight of 8.10 KDB. The protein has homology to rat protein seteroid-binding protein C3. Antibodies which bind hESF proteins, such as hESF I, hESF II, and hESF III are useful for isolating or to identify clones expressing the bolypeptides or to purify the polypeptides by affinity chromatography. Agonists and antagonists of hESF proteins are useful for treating and/or preventing susceptibility to asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               endometrial specific steroid-binding factors 1, II and III (hESF I, II and III) (hESF I, III and III) (hESF I, II and III) (hESF III)

                                                                                                                                                                                  0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method for assessing whether a patient is afflicted with breast cancer. The method comprises comparing the level of expression of a marker (gene/polypeptide see ACC50076 to ACC50334 and ABR47386 to ABR47632) in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level is an indication that the patient is afflicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               expression
or develop antagonists against the isolated hESF polypeptide. The polypeptides or polymuclectides are useful for treating a patient having a need of hESF I, hESF III or for treating a patient having an eneed to inhibit hESF. The polypeptide is administered by providing to the patient the DNA encoding the hESF polypeptide in vivo (gene therapy). In patients, the disease is asthma. The hESF polypeptides or polymuclectides are also useful for diagnosing a disease or a susceptibility to the disease. The sequence presented is the hESF III
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Meyers RE;

The DNA and protein sequences of the invention are useful for the diagnosis and treatment of cancer and inflammatory bowel disease (e.g. ulcerative colitis or Crohn's disease). The present amino acid sequence represents a human PRO protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New PRO polynuclectide and polypeptide, useful for the manufacture of a medicament for diagnosing or treating cancer or inflammatory bowel disorder e.g., ulcerative colitis or Crohn's disease.
N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1) in the specification). ABN15762 to ABN27525 encode the human ORFX of in the specification). ABN15762 to ABN27525 encode the human ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleotide syndrome associated with ORFX-associated disorders or be used in the threapy. ORFX sequences can be used in the threapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, or portiant of cancer, hyperproliferative disorders, disorders and interpretation cardiovascular diseases, disorders mallitus, systemic contrary at the contrary of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0;

                                                                                                                                                                                                                                                                                                                                                       6-JUN-1
                                                                                                                                                                                                                                                                                                                                                                           .7-JUN-1.8-JUN-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             24 - JUN-1
                                                                                                                                                                                                                  MAY-
  ..
                                                                                                                                                                                                                                    The present sequence is wheat aspartyl-tRNA synthetase of the invention. The aspartyl-tRNA synthetase are used as targets to facilitate designing and identification of inhibitors of the enzymes which are useful as herbicides. All or a substantial portion of the nucleic acid fragments of the present invention are used as probes for genetically and physically mapping the genes that they are a part of, and as markers for traits linked to those genes. Such information is useful in plant breeding in order to develop lines with desired phenotypes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;
                                                                                                                                                                           New isolated polynucleotide encoding an aspartyl-tRNA synthetase useful as targets to facilitate design and/or identification of inhibitors of those enzymes that may be useful as herbicides.

0:
      The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagonosing a bacterial disease, as components of antibacterial vaccines, as targets for anibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for baumannii protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated Arabidopsis genes - useful for producing transgenic plants which show resistance to cell death caused by pathogens or herbicides.
                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the amino acid sequence of LSD1-interacting protein 00 of

Arabidopsis thaliana. LSD1 interacting genes (see AAV66755-67) were isolated from a yeast gene expression library constructed in plasmid pJG4 solated from Arabidopsis leaves infected with Pseudomonas syringae. A two-hybrid system was used with LSD1 short and long open reading frames (see AAV66750-51) as bait. LSD1 (see AAW7236-67) is a novel polypeptide that regulates the initial response of plants to pathogens and the subsequent spread of plant cell death engendered by infection. Since the inactivation of LSD1 by mutation leads to enhanced disease resistance, enhanced resistance to pathogens. Thus, the invention includes all proteins (see AAW72384-96) that interact with the cell death regulator

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           designated ORF (open reading frame) 1-4534, and sequences ABN75054-
ABN79587 represent cDNAs encoding them. The invention also encompasses
polypeptides at least 80% identical to the ORF1-ORF4534 (collectively
referred to as ORFX) proteins, polynucleotides at least 85% identical to
the ORFX nucleic acid sequences, vectors and host cells comprising ORFX
polynucleotides, the recombinant production of ORFX proteins, antibodies
specific for ORFX proteins, methods of detecting ORFX polynucleotides and
activity, and methods of screening for modulators of ORFX expression or
activity, and methods of screening individuals for a predisposition to an
ORFX-associated disorder. The ORFX proteins of the invention have a wide
cange of biological activities, such as cytokine, cell proliferation,
cell differentiation, immune modulation, hematopoiesis regulation,
tissue growth, angiogenesis, activin or inhibin activity, chemotactic/
chemokinetic activity, haemostatic activity, thrombolytic activity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hypothyroidism; cholesterol ester storage disease; infection; vulnerary; vasotropic; antipsoriatic; antidiabetic; cytostatic; nootropic; entropedetive; antidiabetic; cytostatic; nootropic; cardiant; hypotensive; antidiaptycid; antidialmatory; immunomodulator; dermatological; analgesic; virucide; antibacterial; fungicide.

cc receptor/ligand, antinflammatory activity, tumour inhibition activity, and antinfective activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. OFEX proteins, concluded antibodies may be used in the treatment of cancers, concluded actions and antibodies may be used in the treatment of cancers, concluded antibodies may be used in the treatment of cancers, conterns such as peoriasis and benign tumours, conterns and disorders such as peoriasis and Alaheimer's disease, cardiovascular diseases, immune system disorders, disorders related to organ transplantation, disorders of tissue growth and regeneration, diseases such as diabetes mellitus, hypothyroidism, and cholesterol ester storage diseases, and infectious diseases caused by viral, bacterial, chungal and other pathogens. OREX uncleic acids may also be used as a source of primers and probes, in the detection of OREX genomic sequences or transcripts, in the identification and cloning of homologous contensorables, in the identification and cloning of homologous sequences, in genetic diagnosis, and in forensic biology. The OREX nucleic acids may additionally be used to produce transgenic animals which may be useful for studying the function and/or activity of OREX protein, and in drug screening. The OREX proteins may also be used as immunogens to generate specific antibodies, which are useful in the content and monitoring of OREX-associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB146'08-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. In the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, cardiovascular disorders such as myocardial ischaemias; (d) wound healing (e) cardiovascular diseases e.g. cerebral anoxia and epilepsy; and (f) cinfections diseases such as viral, bacterial, fungal and parasitic infections between the sequence data for this pattent did not form part of the printed specification, but was obtained in electronic format directly the wipo int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nervous system antigen polypeptides, and/or treating nervous system cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 11; SEQ ID NO 6027; 1701pp + Sequence Listing; English

The invention relates to isolated nucleic acids encoding plant stress response proteins (including peptide-methionine sulphoxide reductases) appearing as ABUS8184 ABUS81846 (or a protein 80% identical to them) from Zea mays, Oryza sativa, Glycine max, or Triticum aestivum. Also included are expression cassettes, transformed host cells, transgenic plants/seeds, modulating the level of peptide-methionine sulphoxide reductase in a plant and a computer system/data processing system for identifying, analysing, or modelling a genetic sequence. The plant nucleic acid is useful in developing strategies to improve plant response to stress (e.g. drought, heat, radiation or pathogen attack), engineering plants with increased disease and stress resistance, manipulating DNA repair and recombination efficiency, manipulating intracellular protein transport, and improving/protecting grain flavour. The nucleic acids may also be used as probes or amplification primers in the detection, quantitation or isolation of gene transcripts, for recombinant expression of encoded polypeptides, as immunogens in preparing or screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New peptide-methionine sulfoxide reductase and nucleic acids, useful in improving plant response to stress, engineering plants with increased disease and stress resistance, or and improving/protecting grain flavor.
                                                                                                                                  Plant; EST; expressed sequence tag; stress response; drought; heat; radiation; pathogen attack; grain flavour; disease resistance; peptide-methionine sulphoxide reductase; DNA repair; enzyme; intracellular protein transport.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rafalski JA;

Enterococcus facetum encoding an Enterococcus facetum polypeptide

Enterococcus facetum encoding an Enterococcus facetum polypeptide

Composition of 10 fully defined sequences given in the (or comprising 40

Sequential nucleotides chosen from any of the nucleic acids, its

complement or sequences hybridising to it. Also included are a

complement vector comprising the nucleic acid operably linked to

transcription regulatory element, a cell comprising the vector and a

single-stranded probe comprising the nucleic acid. The nucleic acids are

chosen from 3654 disclosed sequences encoding 3654 disclosed proteins.

The nucleic acids is useful for diagnosting pathological conditions

resulting from E. faectum bacterial infection (e.g. urinary tract

infection, bacteraemia, endocarditis, wounds and abdominal-pelvic

infection, and for secrening drugs such as agonists and antagonists. The

nucleic acid is useful for recombinant production of Candida albicans -

derived peptides or antisense polypeptides. Pharmaceutical compositions

and vascoines containing the nucleic acid are useful for preventing or

treating Enterococcus faecium infections. The present sequence represents

one if the disclosed E. faecium proteins.
                                                                                                                                                                                                     .
0
antibodies, and in sense or antisense suppression of one or more genes in a host cell, tissue or plant. The proteins may be used as immunogens or antigens to obtain antibodies specifically immunoreactive with the protein, and in assays for enzyme agonists or antagonists. The present sequence is a plant stress response protein (or fragment)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid derived from Enterococcus faecium encoding an Enterococcus faecium polypeptide useful for detection, prevention and treatment of a pathological condition resulting from a bacterial
                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vaccine, urinary tract infection; bacteraemia; endocarditis; wound; abdominal-pelvic infection.
                                                                                                                                                                                                     ·.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       that are highly expressed in uterine tumour tissue and which have anticancer and oytostatic activity. (A) are used (i) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of uterine or endometrial cancer; (ii) directly for treating these forms of cancer (including expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling BSTS (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that BSTs from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of occurrence in a particular tissue. ANY59941-Y60328 represent protein engagements encoded by the human endometrium tummour cDNA library derived
                                                                 ·.

                                                                                                                                                                                                                                                                                                                                                                                                                                   that are applied to plant crops to protect them from insect damage. The polymorlectides may be used in the production of transgenic plants that express the insecticidal polypeptides and consequently have improved insect resistance compared to non-transformed plants. Monocotyledonous or dicotyledonous plants may be protected in this way, for example corn, wheat, soybean, oat, cotton, rice, rye, sorghum, sugarcane, tomato, tobacco, kapok, flax, potato, barley, turf grass, pasture grass, berry, fruit, legume, vegetable, ornamental plant, shrub, cactus and/or tree coll. A wide range of insects (e.g. gypsy moth, looper, tobacco budworm, cotton leaf perforator and spruce budworm) may be affected by application of the insecticidal polypeptides (full details given in specification)
                                                                                                                                                       Lepidopteran-active Bacillus thuringiensis delta-endotoxin polypeptides and the polynucleotides that encode them, useful for increasing the
                                                                                                                                                                                                                                                                                                                                                    The sequence represents a B. thuringiensis Lepidopteran-active delta-endotoxin, crystal protein CryET44. The Lepidopteran-active B. thuringiensis delta-endotoxin polypeptides may be used as compositions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a polypeptide (1) containing an the memoglobulin (1g) heavy chain dimer having no 1g light chain in which the amino acid sequence of a ligand-combined partner is a receptor, a carrier protein, a hormone, a growth factor, an enzyme or a nutritive substance, but is not a subunit polypeptide encoded by a lymphocyte inducing receptor, an 1g gene super family-constituting element, a protein homologous to it, or a separated gene substitute of the variable region of at least one 1g heavy chain. Its combined partner is fused with the amino acid sequence of an 1g stationary region at its C-end and maintains its combining feature. Also described: (1) a nucleic acid maintains its combining feature. Also described: (1) a nucleic acid (1); (2) a replicable expression vector containing the nucleic acid of (1); (3) a composition containing cells transformed by the expression vector of (2); and (4) producing (1), comprising culturing the colls of (1); (3) a composition molecule and a ligand. In an example from the cell surface alignated is useful as a cell surface adhesion molecule and a ligand. In an example from the present sequence represents an amino acid sequence given in comparison with an MLHR anino acid sequence, which is used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Delta endotoxin, Lepidopteran-active, crystal protein, insecticide, transgenic plant; corn, wheat; soybean; oat; cotton; rice; rye; sorghum; sugarcane; tomato; tobaco; kapok; flax; potato; barley; turf grass; pasture grass; berry; fruit; legume; vegetable; ornamental plant; shrub; cactus; tree cell; gypsy moth; looper; tobacco budworm; spruce budworm; cotton leaf perforator; CryET45.
                                                                                                                                                                                                                                                  A fused protein consisting of a ligand-combined protein and a stable plasma protein, a polypeptide, a nucleic acid, a replicable expression vector, a composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ·

The Lepidopteran-active B. thuringiensis delta-endotoxin polypeptides may be used as compositions that are applied to plant crops to protect them from insect damage. The polymucleotides may be used in the production of transgenic plants that express the insecticidal polypeptides and consequently have improved insect resistance compared to non-transformed plants. Monocotyledonous or dicotyledonous plants may be protected in this way, for example corn, wheat, soybean, oat, cotton, rice, rye, sorghum, sugarcane, tomato, tobacco, kapok, flax, potato, barley, tuff grass, pasture grass, berry, tobacco, kapok, flax, potato, barley, tuff grass, pasture grass, berry, to and removed the insection leaf perforator and spruce budworm) may be affected by application of the insecticidal polypeptides (full details given in specification)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or blodgegadation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese. Note: The sequence data for this patent is based on equivalent opatent WO200177334 (published 18-0CT-2001) which is available in electronic format directly from WIPO at the production of 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               that are applied to plant crops to protect them from insect damage. The polynucleotides may be used in the production of transgenic plants that express the insecticidal polypeptides and consequently have improved insect resistance compared to non-transformed plants. Monocotyledonous or dicotyledonous plants may be protected in this way, for example corn, wheat, soybean, oat, cotton, rice, rye, sorghum, sugarcane, tomato, tobacco, kapok, flax, potato, barley, turf grass, pasture grass, berry, fruit, legume, vegetable, ornamental plant, shrub, cactus and/or tree cell. A wide range of insects (e.g. gypsy moth, looper, tobacco budworm,
